

MedRite-XL

DOCUMENT MANAGEMENT AND TRANSCRIPTION

Equipped with extensive productivity tools, detailed management reporting and countless integration and report distribution options, MedRite-XL is the cost-effective solution to creating and managing electronic medical documents. MedRite-XL is a complete voice to distribution transcription system, built to address the needs of facilities with intensive documentation workflows.

EFFORTLESS TRANSCRIPTION. Thanks to a wealth of productivity tools, MedRite-XL lessens the strain on Transcriptionists while keeping focus on the task of typing quality reports. A word expansion utility eliminates repetitive typing, quick keys reduce keystrokes and eliminate the need for a mouse and a STAT key allows for interruption of work without loss of the report. Other features include a chat utility, post-it note functionality and unclear dictation markers to flag difficulties within a report.

TEMPLATE PULL-UP. Based on the selected client and work type, the system generates the proper template and compiles the demographic data from the Transcription Entry Screen (TES). The page format, fonts, headers, footers, logos, printer selections and other details are predefined so that only the dictated report remains to be entered. TES can be changed at any time and the changes are automatically reflected in the report with no user intervention. Once complete MedRite-XL automatically names, files, faxes, emails, carbon copies and prints the report based on the settings.

QUALITY CONTROL. The system ensures that errors are easily tracked and reported back to the Transcriptionist. If a user experiences difficulty with a dictation, work is automatically routed back to the QC auditors. Sampling is even possible and can be based on transcriptionist, author, work type or client.

SPEECH PROCESSING. MedRite-XL integrates with Crescendo Speech Processing to further accelerate the report creation process. Speech Recognition provides significant productivity improvements as the document is available for edit the moment dictation is complete. Once the report has been completely reviewed, the system will automatically update, spell check, count, upload and distribute the final document.

REPORT DISTRIBUTION. MedRouter, an integrated component of MedRite-XL, automatically handles all distribution, imports and exports, and supervises transcribed files. MedRouter allows for electronic sorting and distribution of each report copy to individual department printers. Subject name or number can be used to sort the original copies, while author copies can be sorted by the author's name and nursing unit copies by room number. Supervisors also have the option of setting up distribution methods on an individual basis or by work type, including print, fax and e-mail.

The CSCFax Server can easily be integrated with MedRite-XL in order to handle the most demanding fax needs. Fax requests can be issued automatically, upon creation or when viewing existing reports. Up to 99 priority levels can be set and the system can even create fax cover sheets, filling in appropriate data from the report and allowing for default or user added messages.

SUPERVISOR CONTROL. Supervisors can have complete control over the transcription workflow while seamlessly handling the most demanding distribution needs. MedRite-XL management reporting capabilities include basic detailed production, turnaround and workload reports, providing full visibility over productivity levels. MedRite-XL also simplifies system profiling by allowing supervisors to easily add new clients, work types, users and transcriptionists, without interrupting system operation.

PAY AND BILLING. MedRite-XL provides extensive possibilities for setting count and pay factors. Pay and billing can also be configured to reflect the use of a speech processing engine. The transcriptionist profile can be set up to compensate for corrections, per report, or on an hourly basis.

CLIENT VIEW. Ideal for remote environments, Client-IP provides a single point of access for clients or associate healthcare professionals who need to access medical reports in a secure and timely manner. An affordable solution for clinics and physician offices, Client-IP simplifies and improves the process of verifying the progress of a dictation and can also be used to effectively provide fingertip access to department supervisors and lead transcriptionists.

ELECTRONIC SIGNATURE. MD Center-XL is an electronic module that automates the process of reviewing, editing, and authenticating medical reports from any location, at any time, via network or remote PC. When integrated with MedRite-XL, a complete solution can be realized from the transcription to authentication and distribution of final reports.

SECURITY. For the transfer of files, both MedRite-XL and Client-IP operate through Crescendo Wide Area Service, a real-time and secure gateway to the central server. By guaranteeing that no files or databases are ever kept locally and that authorized users have access to the system at all times from any location, CWAS is the most reliable answer when it comes to sharing sensitive data among individuals, departments and cross-regional locations.

Only authorized users can log into the system, through configurable options, each user profile can be tailored to authorize access to only the appropriate areas of the application. Restrictions can be specified by facilities, clients, departments and work types, or a combination of these elements. In addition to these restrictions, access to specific functions can be limited (ie: preventing users from producing reports or making changes to their respective profiles).

INTEGRATION. MedRite-XL can be implemented with the Crescendo DigiScribe-XL dictation system or the Centro Clinical Documentation System to provide a single text-and-voice application, thereby eliminating repetitive keystrokes and loss of focus while reducing the learning and support curve required when implementing multiple vendor systems. Nevertheless, like all Crescendo solutions, MedRite-XL was designed to seamlessly integrate with a facility's existing infrastructure - including the systems of third party vendors - allowing significant cost savings on equipment. MedRite-XL is a truly flexible solution capable of virtually unlimited expansion.

OPTIONS

- > Support of drug dictionary
- > Support of medical word list
- > Procedural automation
- > Batch faxing up to 99 priority levels
- > Electronic distribution
- > Remote transcription support
- > Interface with third party

SYSTEM SET-UP

- > Standalone
- > LAN
- > WAN
- > Remote user
